💬 Stupidism 🐙 Stupidism

Great wisdom looks stupid, great skill seems clumsy. 中文简历地址: <https://stupidism.github.io/resume-cn/>

SKILLS

Front-end Development

Master

react typescript react-query
restful jest cypress
storybook antd payloadcms
shadcn/ui styled-components
tailwindcss graphql

Front-end Architecture

Master

mono-repo nx github actions
webpack vercel babel aws
openapi atomic design
backward compatibility docker

Back-end Development

Advanced

nodejs nextjs koajs drizzle
prisma postgresql mongodb
mongoose

WORK EXPERIENCE (5)

Senior Frontend Engineer at Workstream March 2023- Current

<https://www.workstream.us/>

As a senior front-end engineer at Workstream, I lead the hiring product's development and architecture within our monorepo. Additionally, I serve as the go-to person for front-end inquiries across the entire engineering team.

- Maintained and developed new features for the hiring product, dedicating over 50% of my time to this task.
- Voluntarily collaborated with the design team to establish a design system. Implemented a component library based on it and collaborated with other squads and front-end engineers to refactor existing code, integrating the new design system using feature flags.
- Optimized the CI/CD workflow and documented frontend best practices extensively.
- Introduced and managed a monorepo to streamline multiple front-end projects, including apps for various squads, a component library for design system and several sharable component/hook libraries among different products.
- Facilitated frontend engineering meetings to discuss technical plans, share updates, and troubleshoot issues.
- Voluntarily managed a Jira board to oversee tasks for all frontend engineers, including epics such as component library implementation and adoption, scaffold maintenance, regular library upgrades, and dependency convergence.

Staff Software Engineer at Jerry February 2021- February 2023

<https://www.getjerry.com/>

As a staff front-end engineer in the SEO & Content team, I participated in the development and revamping of the getjerry.com website and internal CMS. I optimized the workflow and established component design and code standards.

- Led a front-end team, providing technical leadership and supporting the SEO team by building and maintaining a CMS system. Led over 4 website revamps, resulting in significant growth of Google Search Console impressions from 1M to approximately 4M within one year.
- Collaborated with the design team to refine the development process using a design system and component library based on the Atomic design pattern. Effectively addressed the challenge of miscommunication between engineers and designers caused by geographical and language differences.
- Refactored the website's code from vertical-split web-apps to component-layer-split apps and libraries in a monorepo. Resolved issues related to code sharing and simplified deployment complexities associated with vertical-split web-apps.
- Introduced a new code-first CMS to replace the old self-developed CMS, improving the user experience for editors and enabling a clear separation of hard-coded content and design.
- Implemented a 3-level content model for the section-richtext-component, addressing challenges related to page layout/templates, rich content, and component reuse in the SEO domain (similar to a no-code platform).
- Implemented a per-branch deployment mechanism based on Vercel to manage increasing deployment conflicts in a single-stage environment and facilitate preview links before code review for pull requests.
- Advocated for the adoption of TypeScript in both front-end and back-end processes, ensuring better control over data flow from input and out step without unnecessary abuse.
- Created and enforced a front-end code convention to ensure consistent code style across all front-end applications. The convention can be found at: <https://github.com/Stupidism/stupic>

Front-end Engineer at Pinduoduo April 2020- January 2021

<https://www.pinduoduo.com/>

Developed five front-end projects (1 in Vue, 4 in React) for three business groups as a dedicated front-end engineer in the Storage-Infra team. Also contributed to DevOps and engineering work as a member of the Admin-FE team.

- Took over an old data service platform that integrated storage, conversion, validation, and searching functionalities. Collaborated with the back-end team to optimize operations, reducing personnel requirements from 3 to 1. Analyzed pain points, re-identified core concepts, redesigned pages, and standardized forms.
- Participated in building two web apps (user-end and ops-end) from scratch for a new data-searching service platform. Contributed to requirements analysis, prototype design, data structure, API design, web app development, DevOps setup, and documentation.
- Developed a SQL editor based on monaco-editor, providing highlights, auto-completion, syntax validation, and metadata parsing for the SQL dialect used in the search platform.
- Established a monorepo within the front-end team to facilitate code sharing for DevOps tools, code generators, components, hooks, app layout, API definitions, TypeScript types, etc. Built four projects of my own and three projects from other team members.
- Created a TypeScript-based component code generator in the monorepo using @angular/schematics. The generator creates various types of components and API hooks, including lists, forms, modals, details, selects, and status tags.
- Introduced a file structure for components that separates exports, types, rendering, logic hooks, styles, and constants. This separation enhances business logic clarity, code readability, debugging, refactoring, testing, and performance, making it easier even for new graduates to write high-quality code within the framework.
- Developed an API hook library based on useSWR and axios-hooks, simplifying backend API calls for front-end projects. With TypeScript types, developers only need one line of code to call an API and receive the return value along with metadata.
- Currently involved in developing the web app for a new admin platform for ElasticSearch, which is an updated version of the ElasticSearch storage part of the old platform.

Software Engineer II at WeWork April 2018- April 2020

[Team1] Led a team of 4 front-end engineers at wework.cn. [Team2] Spearheaded the re-architecture of a multi-team, multi-framework CMS project.

- [Team1] Rebuilt wework.cn, recruited and onboarded 3 front-end engineers, and successfully led 2 major revamps. Collaborated closely with PMs to analyze requirements and delegated tasks to other front-end engineers over a span of six months.
- [Team2] Proposed and implemented a novel architecture utilizing a mono-repo and micro-frontend approach, effectively resolving maintenance challenges arising from diverse languages and teams.
- Developed and maintained a comprehensive component library comprising more than 22 business components, in close collaboration with designers.
- Enhanced and maintained test coverage above 95%. Implemented A/B testing methodologies and conducted multiple tests with PMs and data engineers to introduce innovative features.
- Designed a streamlined and traceable workflow, incorporating branch-based test links and a tag-based deployment strategy.

Front-end Engineer at Clarity Movement Co. **February 2016- March 2018**

<https://clarity.io/>

Sole front-end engineer responsible for developing data virtualization websites.

- Utilized echarts and Google Maps to visualize air quality data. Leveraged UI libraries such as echarts, Material-UI, Bootstrap, and Antd.
- Designed interactive wireframe prototypes using Balsamiq for select projects.
- Developed multiple crawler scripts in Node.js to extract third-party AQI (Air Quality Index) data.
- Contributed to the open-source community by releasing a component library, a test utility, and a starter project.

VOLUNTEER

Founder at WeLunch

May 2019 - Current

Founded and operated a community within the WeWork headquarters, aiming to provide affordable, healthy, and delicious lunches for all colleagues.

- Built a WeLunch community with approximately 220 members out of 600 employees in our headquarters, averaging about 20 orders per day.
- Successfully sustained the WeLunch community for over 3 years after my resignation, demonstrating its continued success and viability.

Vice Captain at SJTU Software School Youth Volunteers

September 2012 - July 2014

Participated as a volunteer and took on the role of Vice Captain, organizing various activities.

- Organized and conducted 'Interest Lessons' for a middle school near SJTU.
- Assisted elderly members of a community in resolving computer-related issues.

EDUCATION (1)

Bachelor Software Engineering at Shanghai Jiao Tong University

2012 - 2016

Grade: 3.65

AWARDS

China SSOIE Competition 2nd Prize at MOE of China, MOC of China, Wuxi Government

2014

Led light coded transimition. 'SSOIE' for 'Student Service Outsourcing Innovation and Entrepreneurship'
